

Setting up App

Selecting the preference "Scan for App Codes" will scan the driver-internal database of available Samsung Application Codes. If found, an App will then be added to the state.appData for use in both the appRunByName and preset functions.

If an app is not on the list, but on your TV, enable the SmartThings interface. Then run the app. The driver will automatically update state.appData based on the data provided in the ST interface (will try). If this occurs, send the appCode and appTitle to the developer for update to the driver-internal database. After state.appData is updated, you can disable the ST interface (if desired).

Preset Interface

The preset interface is designed to allow use of dashboards to program presets and run the presets as a button. The presets are 1-10 using buttons 51-60.

Presets are set up or updated in a two button process:

- a. Select button 50, presetUpdateNext
- b. Select the button for the preset you want to update within 5 seconds.

Presets are played by selecting the desired preset button.
